# Standards are the Foundation of Data Ecosystems

By Dr. Nadine Alameh

**I**ocation counts. There is no dearth of articles and talks around the ‘new spatial revolution’ or how ‘location is at the heart of Industry 4.0.’ The fact is that geospatial has finally moved up the value chain and is now being acknowledged as both an enabler *and* a differentiator in more domains than can fit in this article.

More Prime Read

The growing recognition of ‘geospatial’ is largely due to location’s unparalleled ability to function as the organizing principle that unites heterogeneous data. But while location allows us to *contextualize* diverse data, the ability to *seamlessly integrate* it for analysis requires standards.

Geo4SDGs:  
Relevance to  
the Digital Age

## Seamless data integration

Over time our community has evolved from being seen as geospatial pioneers to GIS technologists, and now, to experts at using location to integrate diverse data and create new value. One current example of this location-based value is how the geospatial industry mobilized to support responses to the COVID pandemic. Every dashboard, every quarantine/de-quarantine plan, and every contact-tracing app relies on location for data integration and contextualization, and every one of these applications is creating tremendous value for communities the world over.

htt

Data integration sits at the heart of the decision-making, analysis, and prediction processes that help us make sense of, and exist in, our world. Because of humanity's newfound appetite for – even reliance on – data, we continue to invent new technologies that generate data about nearly every aspect of human activity

## **Standards and interoperability**

The only way to create such a data ecosystem is for data providers and software developers to agree upon a set of standards that guarantee interoperability.

Consensus-based open standards, when created by an engaged user community, ensure interoperability, enhance collaboration, and create a diverse, interoperable, decentralized software and data ecosystem that benefits all participants.

Simultaneously, this means that the only requirement for participation in the ecosystem is compliance with its standards, making it as accessible for the small players as it does the large.

While it's impossible to create universal, perpetual standards, it *is* possible to design them to easily evolve in-step with technological progress, so that we don't have to start from scratch every few years. This is why the new OGC API family of standards are being developed in a fully modular and extensible fashion, and with

# As Normas (standard)

O que é uma norma?

“regra de procedimento; princípio; modelo; lei.”

**As boas normas são simples e únicas**

Por exemplo as letras romanas são usadas há mais de 2000 anos e são capazes de se adaptar à maioria das línguas do mundo.

Por contraste os números romanos não tiveram tanto sucesso como norma e acabaram por desaparecer.

# Características das Normas

+1

Todos os dias contactamos com normas e quase não nos apercebemos do quanto estas contribuem para a simplificação ou facilitação de tarefas.

São exemplos:

Folha de papel A4, A3, etc

Formatos de ficheiros

- \*.DOC (Microsoft Word),
- \*.TIF, (Tagged Interchange Format, Adobe)
- \*.DXF (AutoCad), \*.shp (Shape ESRI)

# Perspectiva Linguística

(Em inglês o termo correspondente a **norma** é “**standard**”, em Francês “**la norme**” e alemão “**die Norm**”).

Uma organização internacional como a ISO (International Organization for Standardization) publica normas formais que têm algum nível de relevância no domínio das aplicações.

Estas normas são referidas por “**de-jure**” (“*pela lei*”)

As empresas desenvolvem normas com o objectivo de melhor operar com os seus produtos.

Se o “standard” for bem aceite pela comunidade torna-se uma norma “**de-facto**” (“*na prática*”)

# Perspectiva Económica

O motivo para a industria investir na normalização é o retorno financeiro. Um estudo provou que os ganhos de normalização na industria alemã eram de 15 mil milhões de euros anuais (em 2000).

As razões para este ganhos são:

1. Normalização evita a opção de interfaces para um variado número de aplicações
2. Participação no processo de normalização coloca as empresas em vantagem relativamente às outras que não participam
3. As normas permitem as empresas terem vários fornecedores
4. As normas suportam o processo legislativo. Cerca de 20% das normas alemãs (DIN) são referenciadas por leis. Neste sentido as normas simplificam o processo legislativo

# Perspectiva Nacional

Os princípios de normalização são:

Faz uma vez,

faz certo,

faz internacionalmente

No domínio das Tecnologias da Informação qualquer abordagem de âmbito nacional só poderá ser vista como referência de uma solução internacional.

De qualquer modo, as normas internacionais têm de ser adaptadas a cada país (linguística) e devem obter o contributo dos vários Estados.

Em Portugal a instituição participante é o  
**IPQ (Instituto Português de Qualidade)**

# O Instituto Portugues de Qualidade

"No quadro do Sistema Português da Qualidade (SPQ) - Decreto-Lei nº 142/2007, de 27 de Abril - o IPQ, como Organismo Nacional de Normalização (ONN), coordena a actividade normativa nacional, a qual está definida nas "Regras e Procedimentos para a Normalização Portuguesa, aprovadas por Despacho IPQ nº 26/2010 de 28 de Setembro."

"No que concerne à participação ao nível internacional, o IPQ assegura a representação de Portugal em inúmeras estruturas europeias e internacionais relevantes para a sua missão, designadamente,

*European Committee for Standardization (CEN),*

*European Committee for Electrotechnical Standardization (CENELEC),*

*International Electrotechnical Commission (IEC),*

*Conference General des Poids et Mesures (CGPM),*

*International Organization for Legal Metrology (OIML), e*

*International Organization for Standardization (ISO)."*

## NORMALIZAÇÃO

ORGANISMO NACIONAL DE NORMALIZAÇÃO

+

As normas dão um enorme contributo em muitos aspetos das nossas vidas, embora muitas vezes, seja um contributo imperceptível para o cidadão.

A IMPORTÂNCIA DA NORMALIZAÇÃO

+

A vida seria muito difícil sem normas. O que aconteceria se, por exemplo, não existissem normas sobre produtos de construção, material elétrico ou sobre segurança de equipamentos? A título de exemplo sem dimensões normalizadas de contentores de carga, o comércio internacional seria mais lento e caro.

ATIVIDADE NORMATIVA NACIONAL

+

Habitualmente desconhecemos o papel desempenhado pelas normas no aumento dos níveis de qualidade, segurança, eficiência, interoperabilidade, bem como no fornecimento de todos estes benefícios, com um custo mais económico.

REGRAS E PROCEDIMENTOS DA NORMALIZAÇÃO PORTUGUESA

+

Qualquer norma é considerada uma referência idónea do mercado a que se destina, sendo por isso usada em processos de legislação, de acreditação, de certificação, de metrologia, de informação técnica e de relações comerciais Cliente - Fornecedor.

ENTIDADES PARCEIRAS (ONS/OGCT)

+

As normas são documentos de aplicação voluntária, salvo se existe um diploma legal que as torne de cumprimento obrigatório.

COMISSÕES TÉCNICAS DE NORMALIZAÇÃO

Cada um de nós no desempenho da sua atividade particular ou profissional rege-se, consciente ou inconscientemente, por normas.

A Normalização é a atividade que, de forma organizada, viabiliza a elaboração das normas.

As normas tornam a nossa vida mais fácil e incrementam o progresso. Se não acreditam, atentem no seguinte: quando nos deslocamos de automóvel, o combustível utilizado (gasolina sem chumbo) está normalizado pela EN 228, ou quando lavamos, secamos e passamos roupa temos, por trás do bom desempenho dos aparelhos utilizados, as normas NP EN 60335-2-7, NP EN 61121 e NP EN 60335-2-3, respetivamente.

As normas são documentos de caráter voluntário que definem requisitos técnicos aos quais respondem:

- produtos - por ex. capacetes de segurança industrial (EN 397); telefones móveis (NP EN 50360); panelas de pressão (NP EN 12778); brinquedos (segurança - série NP EN 71);
- métodos de ensaio - por ex. microbiologia alimentar - leites - contagem de bactérias termorresistentes (NP 462);
- processos de produção - por ex. funções e instrumentação para a medição e controlo de processos industriais (NP ISO 3511-1).

A atividade de Normalização nasceu da necessidade de dar resposta a problemas de natureza técnico-industrial, mas a tendência mais recente da normalização abrange áreas de um âmbito muito mais alargado como:

- serviços - por ex. turismo de habitação e turismo no espaço rural (NP 4494); transporte público de passageiros - rede de metro e linhas de autocarro urbano (NP 4475 e NP 4493 respetivamente);
- sistemas de gestão - por ex. sistemas de gestão da qualidade (NP EN ISO 9001); sistemas de gestão ambiental (NP EN ISO 14001); sistema de gestão de recursos humanos (NP 4427);
- questões de ordem ambiental - por ex. avaliação ambiental de sítios e organizações (NP ISO 14015); rótulos e declarações ambientais (NP EN ISO 14020);
- inovação - por ex. gestão da investigação, desenvolvimento e inovação (NP 4457);
- social - responsabilidade social (NP ISO 26000) e a ética (NP 4460-1).

A Normalização propicia a redução de custos para fornecedores e clientes, aumenta a transparência do mercado, ajudando a criar novos negócios e mantendo os existentes, pois são um meio de garantir aos clientes que os produtos/serviços detêm o adequado grau de qualidade, segurança e respeito pelo ambiente.

As normas facilitam igualmente as trocas comerciais na medida em que, para além da diminuição dos custos, reduzem as assimetrias de informação entre a oferta e a procura. Numa economia aberta como é a economia portuguesa, as atividades de Normalização são de extrema importância para reforço e credibilidade das transações comerciais, sejam elas efetuadas no mercado nacional ou além-fronteiras.

# Características das Normas

+2

Um outro tipo de normas são as normas da série ISO9000 para gestão de qualidade.

É definido um conjunto de regras para investigar a eficiência na gestão da qualidade numa organização

Estes exemplos ilustram a natureza heterogénea da normalização.

As normas podem ser:

- Orientadas para a gestão ou técnicas
- Detalhadas ou abstractas
- Resultado do consenso internacional ou o resultado do desenvolvimento de uma empresa

# Organizações Internacionais de Normalização

+2

---

As várias organizações internacionais de normalização podem ser divididas em dois grupos:

## Organizações Internacionais

A sua decisão é baseada no consenso

O seu funcionamento é baseado no financiamento de cada estado membro em função do seu potencial económico permitindo funcionar de forma independente dos estados ou empresas.

Exemplos:

ISO – International Organisation for Standardization

IEC - International Electrotechnical Organization

ITU – International Telecommunication Union

# Organizações Internacionais de Normalização

## Consórcios Internacionais

São liderados pela indústria com participação de agências governamentais.

O objectivo principal é defender os interesses dos seus membros.

Um dos interesses será desenvolver normas comuns de modo a potenciar outros desenvolvimentos (as normas “de-facto”)

Exemplos:

OGC – Open Geospatial Consortium

(o maior e mais importante consorcio da comunidade da IG)

W3C – World Wide Web Consortium

# The Latest Innovations in the Location and Geospatial Ecosystem

## The Home of Location Technology Innovation and Collaboration

### Your Global Resource for Geospatial Information and Standards

Welcome to OGC, a worldwide community committed to improving access to geospatial, or location information. We connect people, communities, and technology to solve global challenges and address everyday needs. The organization represents over 500 businesses, government agencies, research organizations, and universities united with a desire to make location information FAIR – Findable, Accessible, Interoperable, and Reusable.

Our community creates free, publicly available geospatial standards that enable new technologies. OGC also manages an agile and collaborative research & development process - the OGC Innovation Program - that anticipates and solves real-world geospatial challenges experienced by our members. ## OGC Standards and Resources

### OGC Standards and Resources: Made by our Member Community for use by the Global Community

Standards	Registries	Best Practices	Community Practices
  International standards that detail conceptual models, interfaces, or encodings to enable interoperability. <a href="#">View all OGC Standards</a>	  Web accessible sources of information about things ("Concepts") the OGC defines or that communities ask that we host on their behalf. Applies FAIR principles for interoperability in systems. <a href="#">Visit the OGC Definition Server</a>	  Member-agreed and -approved documents describing the use of one or more OGC standards to address a domain-specific topic or provide a solution to an interoperability challenge. <a href="#">Read More on Best Practices</a>	  Documents describing implemented standards, specifications, or technologies that originate outside of OGC, but also address interoperability requirements in geospatial and related communities.
Engineering Reports	Discussion Papers	White Papers	OGC Reference Model
  Developed in the OGC Innovation Program to highlight the initiatives completed by OGC members. They document the partners involved, the standards used, their importance, and potential future impacts. <a href="#">Read more about Engineering Reports</a>	  Technology issues being considered in the Working Groups of the OGC Technical Committee. They create discussion in the geospatial information industry. <a href="#">Read more about Discussion Papers</a>	  Technology issues of interest to OGC Members and the geospatial community at large. They provide necessary background to highlight and forecast information and trends. <a href="#">Read more about White Papers</a>	  The OGC Reference Model (ORM) describes the OGC Standards Baseline and the relationships between the baseline documents. <a href="#">Read the ORM</a>

# OGC Standards

Below is a list of OGC Implementation Standards.

Implementation Standards are different from the Abstract Specification. They are written for a more technical audience and detail the interface structure between software components. An interface specification is considered to be at the implementation level of detail if, when implemented by two different software engineers in ignorance of each other, the resulting components plug and play with each other at that interface.

Any Schemas (xsd, xslt, etc) that support an approved Implementation Standard can be found in the official [OGC Schema Repository](#).

# A ISO (International Organization for Standardization)

+3

A ISA (International Federation of the National Standardizing Associations) foi fundada em 1926 e estava focada na engenharia mecânica. A sua actividade terminou em 1942.

Em 1947 sucedeu-lhe a ISO (International Organization for Standardization) como organização não governamental. A sua sede é em Genebra, Suíça.

O trabalho na ISO é baseado em três princípios:

Consensus

Industry-wide

Voluteering

As diferentes visões dos diferentes parceiros são tomados em consideração. A aprovação de uma norma é feita com 75% dos votantes

As normas deverão sempre conduzir a soluções globais que satisfaçam as necessidades da industria e dos consumidores

É baseado no envolvimento voluntário de todos as partes interessadas

# A ISO (International Organization for Standardization)

O trabalho na ISO é descentralizado

O trabalho de normalização é realizado pelas

**Comissões Técnicas (TC)**

e

**Sub-Comissões (SC)**

Cada TC e SC tem o seu próprio secretariado numa instituição competente num qualquer lugar do mundo. Neste momento a ISO tem 186 TC e 50 SC.

No caso da TC-211 (IG/Geomatics) o secretariado é na Suécia,

O número de membros de um TC pode variar entre os 10 e 1000. No caso da TC211 são cerca de 60 que se encontram 2 vezes por ano.

# Normas da IG-Geomática – TC211

---

As primeiras normas na área da IG surgiram na década de 1990.

(Embora já existissem na Europa há muitos anos normas para a execução de trabalhos nas áreas da Geodesia, Cadastro e Cartografia)

**1991:** O primeiro projecto para normalizar a informação geográfica, liderado pela AFNOR, a agência francesa, a Organização Europeia de Normalização CEN (Comité Européen de Normalisation) criou o Comité Técnico 287 (Geographic Information). O trabalho dessa comissão resultou em 8 pré-normas europeias.

**1994:** ISO/TC211 é criada e a congénere europeia foi extinta.

A Comunidade Europeia implementou recentemente (2007) uma iniciativa chamada INSPIRE que pretende desenvolver uma SDI a nível europeu. Este projeto é suportado nas normas ISO.

A principal força impulsionadora da ISO/TC211 foi a Defence Geospatial Information Working Group (DGIWG) dos EUA e os esforços de normalização nos EUA e Canadá.

As outras duas organizações que contribuíram para o aparecimento da ISO/TC211 foram a IHO (International Hydrographic Organization) e a CEN/TC278 (Geographic Data Files, GDF)

Âmbito:

A Informação Geográfica / Geomática

As normas deverão especificar uma infra-estrutura e os necessários serviços para o manuseamento de dados geográficos incluindo a sua **gestão, aquisição, processamento, análise, acesso, representação e transferência.**

Quando possível a norma deverá estabelecer a ligação com outras normas das Tecnologias da Informação.

## Scope

Standardization in the field of digital geographic information.

This work aims to establish a structured set of standards for information concerning objects or phenomena that are directly or indirectly associated with a location relative to the Earth.

These standards may specify, for geographic information, methods, tools and services for data management (including definition and description), acquiring, processing, analyzing, accessing, presenting and transferring such data in digital/electronic form between different users, systems and locations.

The work shall link to appropriate standards for information technology and data where possible, and provide a framework for the development of sector-specific applications using geographic data.

INTERNATIONAL STANDARD

ISO 19111:2007(E)

### Geographic information — Spatial referencing by coordinates

#### 1 Scope

This International Standard defines the conceptual schema for the description of spatial referencing by coordinates, optionally extended to spatio-temporal referencing. It describes the minimum data required to define one-, two- and three-dimensional spatial coordinate reference systems with an extension to merged spatial-temporal reference systems. It allows additional descriptive information to be provided. It also describes the information required to change coordinates from one coordinate reference system to another.

In this International Standard, a coordinate reference system does not change with time. For coordinate reference systems defined on moving platforms such as cars, ships, aircraft and spacecraft, the transformation to an Earth-fixed coordinate reference system can include a time element.

This International Standard is applicable to producers and users of geographic information. Although it is applicable to digital geographic data, its principles can be extended to many other forms of geographic data such as maps, charts and text documents.

Define sem ambiguidade o assunto do documento e os aspectos abordados indicando os limites de aplicabilidade.

O âmbito deverá ser sucinto de modo a ser usado como sumário para efeitos bibliográficos

# Modelo de Referência (19101)

É assumido na família de normas ISO19100 que :

Por essa razão, a normalização da informação geográfica na série **ISO19100** é baseada na integração de conceitos de IG com conceitos de TI

A ISO19101 (Reference Model) define um modelo de referência hierárquico estruturado para a família ISO19100.

O modelo de referência é uma aplicação especial do “ponto de vista da informação” (semântica da informação e processamento da informação) que é identificado como o mais importante para a normalização da Geomática. Uma componente do modelo de referencia é baseado na abordagem computacional que se reporta aos serviços.

# Modelo de Referência (19101)

+2

# Road-Map das ISO 19100

# ISO 19104 Terminology

---

## B.179

### **feature**

abstraction of real world phenomena

NOTE A feature may occur as a **type** (B.503) or an **instance** (B.253). Feature type or feature instance shall be used when only one is meant.

[ISO 19101:2002]

## B.180

### **feature association**

**relationship** (B.395) that links **instances** (B.253) of one **feature** (B.179) **type** (B.503) with instances of the same or a different feature type

[ISO 19110:2005]

## B.181

### **feature attribute**

characteristic of a **feature** (B.179)

EXAMPLE 1 A feature attribute named “colour” may have an **attribute** (B.18) **value** (B.515) “green” which belongs to the **data type** (B.121) “text”.

EXAMPLE 2 A feature attribute named “length” may have an attribute value “82.4” which belongs to the data type “real”.

# ISO 19104 Terminology

**B.201****geodetic coordinate system**

ellipsoidal coordinate system

coordinate system (B.90) in which position (B.365) is specified by geodetic latitude (B.204), geodetic longitude (B.205) and (in the three-dimensional case) ellipsoidal height (B.156)

[ISO 19111:2007]

**B.202****geodetic datum**

datum (B.124) describing the relationship (B.395) of a two- or three-dimensional coordinate system (B.90) to the Earth

[ISO 19111:2007]

**B.203****geodetic height**

ellipsoidal height

$h$

distance of a point (B.352) from the ellipsoid (B.154), measured along the perpendicular from the ellipsoid to this point, positive if upwards or outside of the ellipsoid

NOTE Only used as part of a three-dimensional **ellipsoidal coordinate system** (B.155) and never on its own.

[ISO 19111:2007]

**B.204****geodetic latitude**

ellipsoidal latitude

$\varphi$

angle from the equatorial plane to the perpendicular to the ellipsoid (B.154) through a given point (B.352), northwards treated as positive

[ISO 19111:2007]

# Aquisição de Dados

A ISO não normaliza os procedimentos de aquisição de dados para um SIG.

As normas ISO 19100 apenas fornecem linhas de orientação e elementos de metadados para descrever a **origem** e **qualidade dos dados**

As normas relevantes são:

- |             |                                   |
|-------------|-----------------------------------|
| ISO 19113   | – Quality principles              |
| ISO 19114   | – Quality Evaluation Procedures * |
| ISO 19115   | – Metadata                        |
| ISO 19115:2 | – Metadata for imagery            |

\* Aconselha sobre os diferentes níveis de detalhe para o controlo de qualidade

# Aquisição de Dados

Supondo que temos de escrever um relatório do controlo de qualidade do nosso SIG. Este relatório deverá ser normalizado de acordo com a norma ISO 19114.

Deverá incluir os valores dos “elementos de qualidade dos dados” (“data quality elements”) da seguinte forma:

Completude (Completeness) : 100%

Consistência Lógica (Logical Consistency) : sem erros

Exactidão posicional (Positional accuracy) :  $\pm 5$  m

Exactidão temporal (temporal accuracy) : a última revisão foi há três anos, a informação da Câmara Municipal foi fornecida na última Primavera.

Exactidão Temática (Thematic accuracy) : a carta topográfica não tem indicação das paragens de autocarro ou outros elementos similares para efeitos de turismo

A ISO19115 (Metadata) fornece as normas formais de todos os elementos necessários

# Representação Gráfica

## Universo do Discurso

## Base de dados

# Relatório da Qualidade (19114)

## G.3.2 Completeness

ISO 19113 defines completeness as the presence and absence of features, their attributes and their relationships. Completeness in this example is classified by feature class. The types of measures tested for are commission and omission. Table G.1 depicts a way to classify completeness.

Table G.1 — Completeness by feature class

Feature class	Number of instances in the universe of discourse	Commission count	Commission percentage <sup>a</sup>	Omission count	Omission percentage <sup>b</sup>
Path	7	0	0	2	29
Road	5	2	40	0	0
Tree	25	3	12	2	7
Industrial building	4	0	0	2	50
House	10	1	10	1	10
Hospital	0	1	100	0	0

<sup>a</sup> Commission percentage = number of included items/number of items in the universe of discourse × 100

<sup>b</sup> Omission percentage = number of omitted items/number of items in the universe of discourse × 100

# Linguagem do esquema conceptual

---

A ISO19103 define um perfil **UML (Unified Modelling language)** para a Informação Geográfica.

A UML é uma norma ISO/IEC 19501-1

EXPRESS é uma linguagem conceptual usada no campo da engenharia mecânica e foi normalizada pela ISO/TC184

Os esquemas conceptuais em UML são baseados em elementos gráficos e léxicos enquanto que os esquemas em EXPRESS contêm apenas texto.

De acordo com as normas ISO 19100 ambas as linguagens são válidas para modelação de IG. Contudo UML é preferível.

# Changes to Access to EPSG definitions from the OGC Definitions Server

Post date: 3 August 2020

Any software implementors that access EPSG Coordinate Reference System (CRS) definitions through the OGC Definitions Server should read this blog post.

Publishing of EPSG CRS definitions through the OGC Definitions Server is enabled by the IOGP Geodetic Registry API ([epsg.org](https://epsg.org)). The IOGP Geodetic Registry API is undergoing an upgrade that will require some changes to both the data model and the interface through which EPSG definitions are retrieved from the OGC Definitions Server.

IOGP will take the legacy IOGP Geodetic Registry API offline in September, 2020. A related announcement is at <https://epsg.org>

Therefore, OGC is planning to reconfigure the OGC Definitions Server to support the upgraded IOGP Geodetic Registry API by then or soon after.

A proposed mapping from the current OGC URIs to the current EPSG URNs and new EPSG URIs is shown below.

OGC Syntax	Current EPSG URN Syntax	Future EPSG URI Syntax	Notes
<a href="http://www.opengis.net/def/epsg/">http://www.opengis.net/def/epsg/</a>	<a href="http://www.epsg-registry.org/export.htm?gml=urn:ogc:def:epsg:">http://www.epsg-registry.org/export.htm?gml=urn:ogc:def:epsg:</a>	<a href="http://apps.epsg.org/def/epsg/">http://apps.epsg.org/def/epsg/</a>	1, 2, 11, 12, 13

## Coordinate Transformation: Cascais height to EVRF2000 height (1)

### Transformation Details [VALID]

NAME: Cascais height to EVRF2000 height (1)

CODE: 5427

VERSION: EuG-Prt

VARIANT: 1

ACCURACY (M): 0.1

USAGE:

#### Usage Details

SCOPE: Change of height to a different vertical reference surface.

EXTENT: Portugal - mainland - onshore

SOURCE CRS: Cascais height

TARGET CRS: EVRF2000 height

TRANSFORMATION  
PARAMETERS:

Parameter	Value	Reversible	Unit
Vertical Offset	-0.315	YES	metre

TRANSFORMATION  
METHOD: Vertical Offset

#### META DATA

REMARKS: Determined at 5 points. RMS residual 0.013m, maximum residual 0.021m. The Cascais vertical reference surface is below the EVRF2000 vertical reference surface.

INFORMATION SOURCE: EuroGeographics, <http://crs.bkg.bund.de/crs-eu/>

# OGC **TECHNOLOGY** TRENDS

Technology that has transformative effects on businesses and society

OGC, as a consortium of over 500 of the most influential geospatial organizations, is the global forum for innovation and standards in location technology. As such, we are uniquely positioned to track the latest tech innovations and forecast their impact on geospatial - something we undertake quarterly as part of our Tech Trends process.

“ Technological change is as inevitable as it is beneficial. However, it's those organizations that anticipate technological change that benefit the most from it.

~George Percivall (OGC Chief Technology Officer and Chief Engineer)

In order to help the 80% of businesses that need to “get smart” about new technologies, we've recently made our Tech Trends insights available for any organization to use in their business planning.

## Subscribe to Tech Trends

A subscription includes **Tech Trends Reports** twice every year, enabling you to:

- **Inform** your organization's strategy using trusted technology forecasting
- **Identify** new areas of investment and potential strategic partnerships
- **Plan** your technology direction using a proven OGC process

# GEOSPATIAL TECHNOLOGY TRENDS

## EMERGENT TRENDS

Clusters of emerging trends that score high on the criteria, assessments and roadmaps are developed and provided in the complete OGC Technology Forecast. For example, COVID-19 has triggered the convergences of multiple geospatial trends in order to respond to the pandemic. Assessments of key trends are conducted to better

characterize the most impactful trends. In a typical report, 6 clusters will be evaluated in-depth. The table below lists the current set of 12 emergent clusters. A full version of the OGC Tech Trends Report provides an in-depth evaluation and development roadmap of several of these clusters.

### EMERGENT TRENDS CLUSTERS:

## TRENDS THAT ARE ASSESSED TO BE BOTH DISRUPTIVE AND NEXT ARE DEEMED TO BE OF THE HIGHEST PRIORITY.

2020-05-23

OGC Takes action based on the OGC Technology Forecast. As a hub for thought leadership and innovation on geospatial standards and innovation for all things related to location - OGC activities in the Standards Program and Innovation Program are developing the next generation geospatial technology ecosystem.

### INSPIRE DIRECTIVE

In Europe a major recent development has been the entering in force of the INSPIRE Directive in May 2007, establishing an infrastructure for spatial information in Europe to support Community environmental policies, and policies or activities which may have an impact on the environment.

INSPIRE is based on the infrastructures for spatial information established and operated by the 27 Member States of the European Union. The Directive addresses 34 spatial data themes needed for environmental applications, with key components specified through technical implementing rules. This makes INSPIRE a unique example of a legislative "regional" approach.

### Legislation

Directive 2007/2/EC of the European Parliament and of the Council of 14 March 2007 establishing an Infrastructure for Spatial Information in the European Community (INSPIRE) was published in the official Journal on the 25th April 2007. The INSPIRE Directive entered into force on the 15th May 2007

To ensure that the spatial data infrastructures of the Member States are compatible and usable in a Community and transboundary context, the Directive requires that common Implementing Rules (IR) are adopted in a number of specific areas (Metadata, Data Specifications, Network Services, Data and Service Sharing and Monitoring and Reporting). These IRs are adopted as Commission Decisions or Regulations, and are binding in their entirety. The Commission is assisted in the process of adopting such rules by a regulatory committee composed of representatives of the Member States and chaired by a representative of the Commission (this is known as the Comitology procedure).

## About INSPIRE

The INSPIRE Directive aims to create a European Union spatial data infrastructure for the purposes of EU environmental policies and policies or activities which may have an impact on the environment. This European Spatial Data Infrastructure will enable the sharing of environmental spatial information among public sector organisations, facilitate public access to spatial information across Europe and assist in policy-making across boundaries.

INSPIRE is based on the infrastructures for spatial information established and operated by the Member States of the European Union. The Directive addresses 34 spatial data themes needed for environmental applications.

The Directive came into force on 15 May 2007 and will be implemented in various stages, with full implementation required by 2021.

This video provides an overview of why INSPIRE is needed and what types of spatial are covered by INSPIRE.

# Data Specifications

The [INSPIRE Implementing Rules on interoperability of spatial data sets and services](#) (IRs) and [Technical Guidelines](#) (Data Specifications) specify common data models, code lists, map layers and additional metadata on the interoperability to be used when exchanging spatial datasets.

Datasets in scope of INSPIRE are ones which come under one or more of the 34 spatial data themes (below) set out in the [INSPIRE Directive](#). Interoperability in INSPIRE means the possibility to combine spatial data and services from different sources across the European Community in a consistent way without involving specific efforts of humans or machines. Interoperability may be achieved by either changing (harmonising) and storing existing data sets or transforming them via services for publication in the INSPIRE infrastructure.

While the Implementing Rules specify what must be implemented at an abstract and generic level, the non-binding [Technical Guidelines](#) specify how legal obligations could be implemented, making reference to existing geospatial standards where appropriate. Implementing these Technical Guidelines will maximise the cross-border and cross-thematic interoperability of INSPIRE spatial data sets and services as well as guaranteeing interoperability with other sectors.

Each Annex has a set of milestones for when metadata, data, and network services for datasets are to be available, set out in [this roadmap](#).

# A Directiva INSPIRE

A presente directiva abrange os conjuntos de dados espaciais que satisfaçam as seguintes condições:

Estarem relacionados com uma zona sobre a qual um Estado-Membro tenha e/ou exerça jurisdição;

Estarem disponíveis em formato digital;

Serem mantidos por entidades públicas (ou terceiras) por conta da mesma;

Dizerem respeito a um ou mais dos temas enumerados nos anexos I, II ou III.

A presente diretiva NÃO exige a recolha de novos dados espaciais.

# Generic Conceptual Model

## Requirement 4

The reference model specified in ISO 19101 shall be used as the reference model of the INSPIRE data specifications.

# Conceptual schema language

**Requirement 20** Every INSPIRE application schema shall be specified in UML, version 2.1.

The use of a common conceptual schema language (i.e. UML) allows for an automated processing of application schemas and the encoding, querying and updating of data based on the application schema – across different themes and different levels of detail.

**Requirement 21** Every spatial object type and its properties shall be shown in class diagrams in the UML package describing the application schema (or packages contained by that package).

**Requirement 22** The use of UML shall conform to ISO 19109 8.3 and ISO/TS 19103 with the exception that UML 2.1 instead of ISO/IEC 19501 shall be used.

# General Feature Model

# General Conceptual Model

# A Directiva INSPIRE

# Methodology for the development of data specifications (D2.6\_v3.0.pdf)

Apart from logical consistency (see the Generic Conceptual Model clause 20), the INSPIRE Directive **does not** spell out

## *(D2.6) 7.5 Data quality*

ISO 19131 requires a data specification to cover the data quality elements and data quality subelements defined in ISO 19113. Those quality elements are:

- Completeness
- Logical Consistency
- Positional Accuracy
- Temporal Accuracy
- Thematic Accuracy

metadata

# Methodology for the development of data specifications (D2.6\_v3.0.pdf)

However, as INSPIRE is based on existing data, it won't be possible that all data sets will be compliant with the quality required (or at least desirable).

## Recommendation 25

Specify the **positional accuracy** desirable in the common data specification; accept deviations and ask data providers to register them in metadata, at data set level.

In the INSPIRE **administrative unit** data specification, there are no mandatory quality requirements. However it is recommended that Member States provide the data at the source accuracy where possible targeting a minimal positional accuracy of **50 meters**. The actual values of data quality elements (omission, topological and conceptual consistency, positional, thematic, and temporal accuracy) have to be published as metadata, when they are available.

# Methodology for the development of data specifications (D2.6\_v3.0.pdf)

## Recommendation 26

The main point to ensure consistency across national boundaries is to combine data sets at similar levels of detail.

## Recommendation 27

The possible levels of detail to be considered for INSPIRE data specifications are:

- European
- National
- Regional
- Local

### Example 1 (geology):

- european level (continent) : from 1 : 5 000 000 to 1 : 1 500 000.
- national level (nation) : 1 : 250 000 to 1 : 1 000 000
- regional level : from 1 : 250 000 to 1 : 25 0000
- local level : scale > 1 : 25 000.

# Definition of Annex Themes and Scope

## Estrutura dos dados Espaciais

Dados referência  
(reference data)

Dados temáticos

Reference data is a series of dataset that everybody involved with geographic information uses to reference his/her own data as part of their work.

It is used as a common base to which **thematic data** may be referenced.

Os dados de referência deve cumprir três requisitos funcionais:

- fornecer uma localização inequívoca para a informação do utilizador
- permitir a fusão de dados de diversas fontes
- Fornecer o contexto que permita aos outros a melhor compreensão do que está a ser apresentado

# Definition of Annex Themes and Scope

## Reference Data

1. Geodetic reference data
2. Units of administration
3. Units of property rights (parcels, buildings)
4. Addresses
5. Selected topographic themes (hydrography, transport, height)
6. Orthoimagery
7. Geographical names

É expectável que os Dados de Referencia sejam produzidos ou organizados pelas Agencias Nacionais de Cartografia e Agencias Cadastrais.

# Anexos

The data themes of INSPIRE are divided in modular blocks. "Annexes I and II focus on reference data, while Annex III focuses on data for environmental analysis and impact assessment.

## Annex I

1. Coordinate reference systems
2. Geographical grid systems
3. Geographical names
4. Administrative units
5. Addresses
6. Cadastral parcels
7. Transport networks
8. Hydrography
9. Protected sites

## Annex II

10. Elevation
11. Land cover
12. Ortho-imagery
13. Geology

## Annex III

14. Statistical units
15. Buildings
16. Soil
17. Land use
18. Human health and safety
19. Utility and governmental services
20. Environmental monitoring facilities
21. Production and industrial facilities
22. Agricultural and aquaculture facilities
23. Population distribution – demography
24. Area management/restriction/regulation zones & reporting units
25. Natural risk zones
26. Atmospheric conditions
27. Meteorological geographical features
28. Oceanographic geographical features
29. Sea regions
30. Bio-geographical regions
31. Habitats and biotopes
32. Species distribution
33. Energy Resources
34. Mineral resources

# Implementation Roadmap

# Coordinate Reference Systems (CRS)

O âmbito do tema *Coordinate reference systems* abrange os *Sistemas de Referencia de Coordenadas Geodésicas* (*Geodetic Coordinate Reference Systems (CRS)*) necessários para referenciar de forma inequivoca a informação espacial como um conjunto de coordenadas (X, Y, Z) e /ou latitude, longitude e altitude .

As coordenadas latitude, longitude e altitude elipsoidal podem ser calculadas a partir das coordenadas (X,Y,Z) usando um elipsóide de referencia.

As **coordenadas planas** (cartográficas) são calculadas a partir da latitude e longitude usando uma projeção cartográfica apropriada. São adoptadas e recomendadas diferentes projeções para diferentes objectivos.

# Coordinate Reference Systems (CRS)

**Requirement 1** For the three-dimensional and two-dimensional (horizontal component) coordinate reference systems, the European Terrestrial Reference System 1989 (ETRS89) shall be used for the areas within the geographical scope of ETRS89.

**Requirement 2** The International Terrestrial Reference System (ITRS) or other geodetic coordinate reference systems compliant with ITRS shall be used in areas that are outside the geographical scope of ETRS89.

**Requirement 3** For the computation of latitude, longitude and ellipsoidal height, and for the computation of plane coordinates using a suitable mapping projection, the parameters of the GRS80 ellipsoid shall be used.

**Requirement 4** For representation with plane coordinates one of the Lambert Azimuthal Equal Area (ETRS89-LAEA), the Lambert Conformal Conic (ETRS89-LCC) or the Transverse Mercator (ETRS89-TMzn) projection shall be used.

# Coordinate Reference Systems (CRS)

**Requirement 8** For the vertical component on land, the European Vertical Reference System (EVRS) shall be used to express gravity-related heights for the areas within the geographical scope of EVRS.

**Requirement 9** Other vertical reference systems related to the Earth gravity field shall be used to express gravity-related heights in areas that are outside the geographical scope of EVRS.

**Recommendation 6** For referring the coordinate reference systems adopted by INSPIRE, identifiers presented in the table 1 are recommended.

**Recommendation 7** For referring a compound CRS, one 2D and one 1D system combined together, the respective identifier shall be created by appending the identifiers of the 2D and 1D CRS with a slash between both.

**EXAMPLE** When both ETRS89-GRS80 and EVRS the CRS used the identifier shall be ETRS89-GRS80/EVRS.

# Coordinate Reference Systems (CRS)

Table 1

Identifier	Type of coordinates
ETRS89-XYZ	Cartesian coordinates in ETRS89 in space (X,Y,Z)
ETRS89-GRS80h	Geodetic (geographic) coordinates and ellipsoidal height in ETRS89 on the GRS80 ellipsoid (Latitude, Longitude, Ellipsoidal height)
ETRS89-GRS80	Geodetic (geographic) coordinates in ETRS89 on the GRS80 (Latitude, Longitude)
EVRS	Height in EVRS (H)
LAT	Depth of the sea floor, where there is an appreciable tidal range (D)
MSL	Depth of the sea floor, in marine areas without an appreciable tidal range, in open oceans and effectively in waters that are deeper than 200m (D)
ISA	Pressure coordinate in the free atmosphere (P)
PFO	Pressure coordinate in the free ocean (P)
ETRS89-LAEA	ETRS89 coordinates projected into plane coordinates by the Lambert Azimuthal Equal Area projection (Y,X)
ETRS89-LCC	ETRS89 coordinates projected into plane coordinates by the Lambert Conformal Conic projection (N,E)
ETRS89-TMzn <sup>18</sup> (29N)	ETRS89 coordinates projected into plane coordinates by the Transverse Mercator projection (N,E)

# Geographical grid systems

Definition:

'grid' means a network composed of two or more sets of curves in which the members of each set intersect the members of the other sets in an algorithmic way,

Geographical Grids

Quadricula Geográfica

**Requirement 1** The Grid\_ETRS89-LAEA as defined in this document shall be used as a geo-referencing framework for the themes where grids with fixed and unambiguously defined locations of equal-area grid cells are needed.

The grid – proposed as the multipurpose Pan-European standard – is based on the ETRS89 Lambert Azimuthal Equal Area coordinate reference system with the centre of the projection at the point  $52^{\circ}$  N,  $10^{\circ}$  E and false northing:  $Y_0 = 3210000$  m, false easting:  $X_0 = 4321000$  m (CRS identifier in INSPIRE: ETRS89-LAEA).

The grid is designated as Grid\_ETRS89-LAEA. For identification of an individual resolution level the cell size in metres is appended to the name.

EXAMPLE The grid at a resolution level of 100km is designated as Grid\_ETRS89-LAEA\_100K.

HUMBOLDT contributes to the implementation of a European Spatial Data Infrastructure (ESDI) that integrates the diversity of spatial data available for a multitude of European organisations. It is the aim to manage and advance important parts of the implementation process of this ESDI.

The main goal of the HUMBOLDT project is to enable organisations to document, publish and harmonise their spatial information. The software tools and processes created will demonstrate the feasibility and benefits of an Infrastructure for Spatial Information in Europe as planned by the INSPIRE initiative ([INSPIRE](#)), meeting the goals of Global Monitoring for Environment and Security ([GMES](#)).

The technical goal of HUMBOLDT is to support Spatial Data Infrastructure (SDI) enablement by providing the functionalities for covering the data harmonisation process as a whole. The HUMBOLDT Tools and Services are built on current state of the art and standards, designed to provide solutions to all types of users, data custodians as well as private end-users. HUMBOLDT enables the use of single functionalities as part of your own infrastructure.

## Test drive HALE 2.8.0

### HALE – The HUMBOLDT Alignment Editor

Status: Stable, active development

The mapping of elements such as Feature Types and Attributes of one conceptual schema (e.g. GML Application Schemas, Database Schemas or UML models) to another is a cornerstone of data harmonisation. The [HUMBOLDT Alignment Editor \(HALE\)](#) is a tool for defining and evaluating conceptual schema mappings. HALE allows domain experts to create logically and semantically consistent mappings and to transform geodata based on these mappings. Furthermore, a major focus is put on the documentation of the schema transformation process and its impacts, e.g. in the form of lineage information attached to the resultant transformed data.

[Watch the HALE Tutorial for getting started!](#)

HALE uses a high-level language for expressing the mappings. They can later be used by the Conceptual Schema Transformer processing component to execute a data transformation, e.g. from a non-harmonised data source to a INSPIRE-compliant data set.

To make this complex process

## GeoServer App-Schema configuration

Publishing OGC services based on GML Application Schemas and Complex Features with GeoServer is now easier than ever. Use HALE to define the mapping from your data store to an application schema, such as INSPIRE or NAS. Then, upload the resulting configuration for the GeoServer App-Schema plugin directly to your GeoServer instance. This feature was developed together with GeoSolutions S.R.L., Italy. More information on the new feature including future plans is available at the [GeoSolutions Blog](#).

VOCÊ ESTÁ EM: Página inicial > Sistemas de Informação > SNIT > IGT em vigor (SNIT) > Acesso Simples

## Acesso Simples

O acesso simples permite consultar os instrumentos de gestão territorial (IGT) em vigor de uma forma simples e direta, bastando para isso indicar a região, o concelho e o tipo de plano pretendido. Inicia-se a consulta com a seleção de uma Região, seguidamente deverá escolher um concelho e, posteriormente, o tipo de IGT que se pretende visualizar. Se pretender visualizar a listagem de todos os IGT em vigor selecionar “todos”. É possível consultar as peças escritas (regulamento), bem como as peças gráficas dos IGT (plantas), no caso da sua existência.
